

PROJECT PROPOSAL (CSE TECH)
HELLO VIT

IDEA:

- A social media application for the students of VIT to express their thoughts, ideas, and pictures around the campus for every VITian to see, they can even use this platform to publicize events since not everybody is added as a follower or a friend on the popular social media apps. This app will only allow students of VIT to be a part of this community, but the public feed will be visible to everybody but not editable by non-VITians.

TECH STACK AND METHOD OF IMPLEMENTATION:

- App will be implemented using XCode.
- Swift language will be used for implementation.
- UI will be implemented using Storyboard on XCode.

WORKING OF THE PROJECT:

- There will be pages for different branches of VIT and students can either share only on their branch page or if they want, they can also express themselves on the University feed which will be visible to everybody. Pages or accounts can be searched using the search bar. In general, the University feed will be visible the first time somebody opens the app after creating their account.
- They can also form private or public group pages through settings to discuss their topic of interest.
- They can also upload pictures through the camera or write down their thoughts.

EXPECTED OUTCOME:

- This project would help us bring together all the VITians on a single platform and form a stronger community together.
- It would help in passing on important information on a larger platform.
