

PROJECT PROPOSAL

COD MEDIATOR

IDEA:

- COD mediator is an application which aims to provide Cash on Delivery (COD) services to all the places where certain e-commerce applications don't. The main idea behind this, is the fact, that in India there are many people who either don't know how to purchase something using net banking or do not trust these methods. So, for such people, COD Mediator would help them in getting their products in an easy and desired manner.

TECH STACK AND METHOD OF IMPLEMENTATION:

- App will be implemented using XCode.
- Swift language will be used for implementation.
- UI will be implemented using Storyboard on XCode.

WORKING OF THE PROJECT:

- This app will first ask the user to create an account with necessary information.
- After completing the above step, user will be asked to paste the link of the product that they want to purchase using COD.
- Then, user will be asked to agree on the terms and conditions, that in any case they will not cancel the order.
- After this the order will be placed and delivered in a few days to the user's address which was asked in the first step.
- In between all these steps, the link will be checked to see whether it is a valid product or a legitimate e-commerce site.

EXPECTED OUTCOME:

- This project would help people who have access to e-commerce sites but are not familiar with the online payment systems.
- Also, in certain places, COD is often denied, so COD mediator would come into the picture and resolve this issue by placing that order through the link in their name and then providing the primary user with their order with COD mode of payment.
