

TECH STACK:

Webflow, HTML, CSS, JavaScript, React, etc.

IDEA: WHAT IS THE WEBSITE FOR?

The website is for people who love animals and would not mind taking some time off their daily life to step into an animal farm and play and work with animals of their choice!

Now imagine having a fun time at a farm AND getting paid for it! How cool is that?!

“LetsFarm” enables you to do exactly that.

METHOD OF IMPLEMENTATION:

- **Registration page:** will be a form using JS along with HTML, CSS.
- **Maps layout:** using react or JS, HTML&CSS.
- **Programs :** using HTML, CSS and JS for customisation and booking.

APPLICATION OF PROJECT:

- Helps farmers gain more
- volunteers and reduces their workload.
- Farm work is not easy and requires you to be fit thus encouraging a healthier body.
- The programs range from one week per month to 4 weeks a month, allowing people to take time off and be with nature for as long as they desire, thus encouraging a healthier mind as well.

EXPECTED OUTCOME:

- When the user opens the website, they are asked to register/sign up by giving personal details such as name, phone number, email, etc. and their current location.
- Once that is done, the user is shown a map highlighting nearby farms.
- When they hover over a farm they like, they see a brief description that includes the name of the farm, the programs they offer, etc.
- On clicking on the farm name on the map, they are taken to another page that shows all the programs with prices and on further choosing a program, full details of the customisable program are shown.
- The user chooses specific components like time slot, animals they want to work with, etc. and submits the details.
- They are then shown a confirmation message and an email is sent to their email ID with confirmed details.
